Introduction to pragmatic clinical trials

How pragmatic clinical trials bridge the gap between research and care
Overview

THE BIG PICTURE

• Major challenges related to traditional clinical research—and the National Institutes of Health’s vision for bridging the gap between research and care

A MORE PRACTICAL APPROACH

• Pragmatic clinical trials—what are they and what are their advantages over traditional randomized trials in terms of relevance and applicability to everyday practice

THE PAYOFF

• How health care systems, providers, and patients will benefit by partnering in pragmatic clinical research
Challenge #1: Clinical research is slow

- To most people, randomized controlled trials (RCTs) are the mainstay of clinical research.
- But traditional RCTs are slow and expensive—and rarely produce findings that are easily put into practice.
- In fact, after an average of 17 years only 14% of research findings will have led to widespread changes in care.¹
Challenge #2: Clinical research is not relevant to practice

- Traditional RCTs study the effectiveness of treatments delivered to carefully selected populations under ideal conditions.
- This makes it difficult to translate results to the real world.
- Even when we do implement a tested intervention into everyday clinical practice, we often see a “voltage drop”—a dramatic decrease in effectiveness.

“If we want more evidence-based practice, we need more practice-based evidence.”

Challenge #3: The evidence paradox

• More than 18,000 RCTs are published each year—in addition to tens of thousands of other clinical studies.

• Yet systematic reviews consistently find that we don’t have enough evidence to effectively inform the clinical decisions providers and patients must make.
We need a more practical, more integrated approach

- Clinical research is more than just traditional RCTs.
- **Pragmatic research** is designed with input from health systems—and produces evidence that can be readily used to improve care.
- By engaging health systems, providers, and patients as partners, pragmatic research accelerates the integration of research, policy, and practice.
The vision: Partnerships that support faster, more relevant research

“Partnerships with health care systems offer an opportunity to transform research and ultimately improve America’s health.”

“Working together, we can achieve our common goal: speeding the movement of scientific discoveries from the lab to patients.”

– NIH Director Francis Collins, MD, PhD
Pragmatic clinical trials: Partnership-based research built to improve care

• Pragmatic clinical trials (PCTs) are designed to improve practice & policy.

• Unlike most traditional RCTs, they take place in settings where everyday care happens, such as community clinics, hospitals, and health systems.

• Collaborating providers and organizations are integral partners and gain practical evidence on how to improve patient health and satisfaction.

• Pragmatic partnerships engage at multiple levels – including patients, practitioners, teams, health systems and communities.
Core characteristics of pragmatic clinical trials (PCTs)$^{2-4}$

- Questions from and important to stakeholders
- Diverse, representative populations
- Multiple, heterogeneous settings
- Multiple outcomes important to decision and policy makers
- Comparison conditions are real-world alternatives, not a placebo or no treatment
### Questions health care teams might ask before participating in any clinical trial

Common pragmatic research features

Use of electronic health records (EHRs)

- EHRs allow efficient and cost-effective, recruitment, data collection, and participant communication, monitoring, & follow up.

Randomization of treatment alternatives based on normal health care operations

- This sometimes mean randomizing at the clinic or provider level ("cluster randomization").
PCTs: Fewer exclusions allow for a broader subset of participants

Traditional RCT

- Eligible population
- Exclusions, non-response, etc.
- Efficacy, among a defined subset

PCT

- Eligible population
- Exclusions, non-response, etc.
- Effectiveness, in a broad subset

The RCT-PCT continuum

- PCTs are not an abandonment of the scientific methods that have led to countless breakthroughs.
- They don’t take away from basic science or diminish the importance of traditional RCTs—we just need a balance.
- No clinical trial is completely explanatory or pragmatic. RCTs and PCTs exist on a continuum.

Explanatory Trial
Can an intervention work under ideal conditions?

Pragmatic Trial
Does an intervention work under usual conditions?
Pragmatic trials have been benefitting health care for decades

1950s
- Polio vaccine studies

1980s & 90s
- Early studies of acute treatment for heart attack

Take-home messages: Why we need PCTs

- We aren’t reaching patients with complex, comorbid problems and those most in need.
- Traditional research rarely happens in typical clinical settings, so findings often aren’t feasible for real-world uptake.
- We aren’t asking questions important to providers, patients, administrators, or policymakers.
Take-home messages: Benefits of PCTs for healthy systems & providers

Actionable

Designed around application to practice, with an emphasis on successful implementation.

Patient-centered

Research questions and goals are strongly aligned with patient-centered research and care.

Relevant

Transparent reporting of results that are focused on issues and data that are relevant for making decisions and taking action.
Questions for discussion

• Tip—when presenting on pragmatic clinical trials to health systems, be sure to elicit their perspective. Getting input from a range of health care personnel as well as researchers is critical to designing and implementing pragmatic clinical trials.
  
  • **What is on your mind?** What are clinical or operational issues that have been struggles and where new answers would help?
  
  • **What is going on?** What is happening in environment (for example a new payment approach or treatment) that might serve as a natural experiment?
Key references and resources

$11.3 million from NIH to engage health care organizations as research partners in large-scale studies designed to yield results relevant to clinical practice.

Seven demonstration projects were funded in 2012—and all include partners from health care systems, provider organizations, and community health centers.
